## ***Psychological Effects of Abortion***

The Newcastle Institute of Public Health conducted a review of clinical studies reports published in Australia and internationally over the past 30 years looking at the psychological consequences of the termination of pregnancy on women<sup>1</sup>. The key finding of this review are of follows.

The overwhelming indication from the literature is that the legal and voluntary termination of pregnancy rarely causes immediate or lasting negative psychological consequences in healthy women.

Negative psychological outcomes tends to be associated with particular personality traits including impulsivity and low self esteem.

Strong partner or parental support for the woman improves psychological outcomes and results in few negative changes to the relationship

The decision to terminate a pregnancy due to medical or genetic reasons seems to have more of a negative impact often eliciting grief and depression among women.

Some studies have reported positive outcomes for women such as relief.

Comprehensive reviews of adolescent specific literature have concluded that the effects on younger women are mild and transitory. Negative outcomes tends to be associated confounding factors such as pre-existing psychological conditions and weak family support.
